Architecture Tradeoff Analysis Method\textsuperscript{SM} (ATAM\textsuperscript{SM})

Software Engineering Institute
Carnegie Mellon University
Pittsburgh, PA 15213

\textsuperscript{SM}ATAM and Architecture Tradeoff Analysis Method are registered service marks of Carnegie Mellon University
Why Analyze Software Architectures?

All design involves tradeoffs in system qualities

• System qualities are largely dependent on architectural decisions

• Promoting one quality often comes at the expense of another quality

A software architecture is the earliest life-cycle artifact that embodies significant design decisions: choices and tradeoffs.

• Choices are easy to make, but hard to change once the system is implemented
The ATAM

SEI has developed the Architecture Tradeoff Analysis Method (ATAM) over several years.

The purpose of ATAM is: to assess the consequences of architectural decision alternatives in light of quality attribute requirements.
Purpose of ATAM - 1

We need a method in which the right questions are asked *early* to:

- Discover *risks* - alternatives that might create future problems in some quality attribute
- Discover *non-risks* - decisions that promote qualities that help realize business/mission goals
- Discover *sensitivity points* - alternatives for which a slight change makes a significant difference in some quality attribute
- Discover *tradeoffs* - decisions affecting more than one quality attribute
The purpose of an ATAM is **NOT** to provide precise analyses . . . the purpose IS to **discover risks created by architectural decisions**.

We want to find *trends*: correlation between architectural decisions and predictions of system properties.

Discovered *risks* can then be made the focus of mitigation activities: e.g. further design, further analysis, prototyping.

Surfaced *tradeoffs* can be explicitly identified and documented.
ATAM Benefits

There are a number of benefits from performing ATAM analyses:

- Clarified quality attribute requirements
- Improved architecture documentation
- Documented basis for architectural decisions
- Identified risks early in the life-cycle
- Increased communication among stakeholders

The results are improved architectures.
Purpose of ATAM

The purpose of ATAM is to assess the consequences of architectural decisions in light of quality attribute requirements.

The ATAM process is a short, facilitated interaction between multiple stakeholders, leading to the identification of risks, sensitivities, and tradeoffs.

The purpose of an ATAM is NOT to provide precise analyses, the purpose IS to discover risks created by architectural decisions.
Preconditions for an ATAM

1. Clients must have a Software Architecture
   - Scope/scale must be manageable
   - ATAM *will not work* if the software architecture has not been created yet
   - ATAM team members will review architectural artifacts, and may help refine documentation
   - Architect must prepare an architecture presentation

2. Clients must prepare a *business/mission goals* presentation

3. ATAM will *review* architecture artifacts, presentations, and read ahead material to become familiar with domain
Evaluation Team

Each **ATAM team** consists of a leader and at least three other team members

- domain expertise is not necessary
- ATAM team members must be experienced architects
- ATAM leaders must have **EXCELLENT** communication and facilitation skills

The ATAM team members fill multiple roles during the course of the evaluation.
Evaluation Team Roles - 1

Moderator — facilitates discussions, brainstorming, analysis

Scenario scribe(s) — writes utility tree, raw scenarios, risks, sensitivities, tradeoffs on flip-charts or whiteboards

Proceedings scribe — captures scribe’s writing on a laptop computer, preparing the Results Presentation template
Process enforcer/observer — monitors the process steps, takes notes about the process, and how it could be improved

Timekeeper — informs the evaluation leader when the time allocated for a step has expired

Questioner(s) — raise issues that the stakeholders have not thought of; asks questions based on how quality attributes of interest relate to architectural styles
Basic Rules for ATAM Team Members

• Keep the process moving!

• Ask questions

• Propose scenarios

• Write down exactly what stakeholders say; do not “edit” their words!
ATAM Steps

1. Present the ATAM
2. Present business drivers
3. Present architecture
4. Identify architectural approaches
5. Generate quality attribute utility tree
6. Analyze architectural approaches
7. Brainstorm and prioritize scenarios
8. Analyze architectural approaches
9. Present results

Phase I

Phase II
1. Present the ATAM

**Evaluation Team** presents an overview of the ATAM including:

- ATAM steps in brief
- **Techniques**
  - utility tree generation
  - architecture elicitation and analysis
  - scenario brainstorming/mapping
- **Outputs**
  - architectural approaches
  - utility tree
  - scenarios
  - risks and “non-risks”
  - sensitivity points and tradeoffs
2. Present Business Drivers

**ATAM customer** representative describes the **system’s** business drivers including:

- Business context for the system
- High-level functional requirements
- High-level quality attribute requirements
  - architectural drivers: quality attributes that “shape” the architecture
  - critical requirements: quality attributes most central to the system’s success
3. Present Architecture

Architect presents an overview of the architecture including:

- Technical constraints such as an OS, hardware, or middle-ware prescribed for use
- Other systems with which the system must interact
- Architectural approaches/styles used to address quality attribute requirements

Evaluation team begins probing for and capturing risks.
ATAM Steps

1. Present the ATAM
2. Present business drivers
3. Present architecture
4. Identify architectural approaches
5. Generate quality attribute utility tree
6. Analyze architectural approaches
7. Brainstorm and prioritize scenarios
8. Analyze architectural approaches
9. Present results

Phase I

Phase II
4. Identify Architectural Approaches

Start to identify places in the architecture that are key for realizing quality attribute goals.

Identify any predominant architectural approaches.

Examples:
- client-server
- 3-tier
- watchdog
- publish-subscribe
- redundant hardware
5. Generate Quality Attribute Utility Tree

Identify, prioritize, and refine the most important quality attribute goals by building a utility tree.

- A utility tree is a top-down vehicle for characterizing the “driving” attribute-specific requirements

- Select the most important quality goals to be the high-level nodes (typically performance, modifiability, security, and availability)

- Scenarios are the leaves of the utility tree

Output: a characterization and a prioritization of specific quality attribute requirements.

High/Medium/Low importance for the success of the system
High/Medium/Low difficulty to achieve (architect’s assessment)
Utility Tree Construction -1

Performance
- Data Latency
- Transaction Throughput

Modifiability
- New product categories
- Change COTS

Availability
- H/W failure
- COTS S/W failures

Security
- Data confidentiality
- Data integrity

Utility

- Add CORBA middleware in < 20 person-months
- Change web user interface in < 4 person-weeks
- Power outage at site1 requires traffic redirected to site2 in < 3 seconds.
- Restart after disk failure in < 5 minutes
- Network failure detected and recovered in < 1.5 minutes

Customer DB authorization works 99.999% of the time

Credit card transactions are secure 99.999% of the time
Utility Tree Construction -2

Utility

Performance
- Data Latency
  - Transaction Throughput
    - Reduce storage latency on customer DB to < 200 ms.
    - Deliver video in real time

Modifiability
- New product categories
  - Add CORBA middleware in < 20 person-months
- Change COTS
  - Change web user interface in < 4 person-weeks

Availability
- H/W failure
  - Power outage at site1 requires traffic redirected to site2 in < 3 seconds.
  - Restart after disk failure in < 5 minutes
- COTS S/W failures
  - Network failure detected and recovered in < 1.5 minutes

Security
- Data confidentiality
  - Credit card transactions are secure 99.999% of the time
  - Customer DB authorization works 99.999% of the time
- Data integrity
Scenarios

Scenarios are used to
- Represent stakeholders’ interests
- Understand quality attribute requirements

Scenarios should cover a range of
- Anticipated uses of (use case scenarios),
- Anticipated changes to (growth scenarios), or
- Unanticipated stresses (exploratory scenarios) to the system.

A good scenario makes clear what the stimulus is that causes it and what responses are of interest.
Example Scenarios

Use case scenario
Remote user requests a database report via the Web during peak period and receives it within 5 seconds.

Growth scenario
Add a new data server to reduce latency in scenario 1 to 2.5 seconds within 1 person-week.

Exploratory scenario
Half of the servers go down during normal operation without affecting overall system availability.

=> Scenarios should be as specific as possible.
Stimuli, Environment, Responses

Use Case Scenario
Remote user requests a database report via the Web during peak period and receives it within 5 seconds.

Growth Scenario
Add a new data server to reduce latency in scenario 1 to 2.5 seconds within 1 person-week.

Exploratory Scenario
Half of the servers go down during normal operation without affecting overall system availability.

=> Scenarios should be as specific as possible.
6. Analyze Architectural Approaches

**Evaluation Team** probes architectural approaches from the point of view of specific quality attributes to identify risks.

- Identify the approaches that pertain to the highest priority quality attribute requirements
- Generate *quality-attribute specific questions* for highest priority quality attribute requirement
- Ask quality-attribute specific questions
- *Identify and record* risks and non-risks, sensitivity points and tradeoffs
Quality Attribute Questions

Quality attribute questions probe styles to elicit architectural decisions which bear on quality attribute requirements.

Performance
- How are priorities assigned to processes?
- What are the message arrival rates?

Modifiability
- Are there any places where layers/facades are circumvented?
- What components rely on detailed knowledge of message formats?
Risks and Non-Risks

Example Risks

• *Rules for writing business logic modules in the second tier of your 3-tier style are not clearly articulated. This could result in replication of functionality thereby compromising modifiability of the third tier.*

Example Non-Risk

• *Assuming message arrival rates of once per second, a processing time of less than 30 ms, and the existence of one higher priority process, a 1 second soft deadline seems reasonable.*
Sensitivities and Tradeoffs

Example Sensitivity
• Changing the timing scheme from a harmonic framework to a non-harmonic framework would be easy, but due to implied timing dependencies, there would be far reaching impacts to other modules.

Example Tradeoffs
• In order to achieve the required level of performance in the discrete event generation component, assembly language had to be used thereby reducing the portability of this component.
ATAM Steps

1. Present the ATAM
2. Present business drivers
3. Present architecture
4. Identify architectural approaches
5. Generate quality attribute utility tree
6. Analyze architectural approaches
7. Brainstorm and prioritize scenarios
8. Analyze architectural approaches
9. Present results

Phase I

Phase II
Stakeholders generate scenarios using a facilitated brainstorming process.

- Scenarios at the leaves of the utility tree serve as examples to facilitate the step.
- The new scenarios are added to the utility tree

Each stakeholder is allocated a number of votes roughly equal to 0.3 x #scenarios.
8. Analyze Architectural Approaches

Identify the architectural approaches impacted by the scenarios generated in the previous step.

This step continues the analysis started in step 6 using the new scenarios.

Continue identifying risks and non-risks.

Continue annotating architectural information.
9. Present Results

Recapitulate steps of the ATAM

Present ATAM outputs
  • architectural approaches
  • utility tree
  • scenarios
  • risks and “non-risks”
  • sensitivity points and tradeoffs
Conceptual Flow of ATAM

- Business Drivers
- Quality Attributes
- Architectural Approaches
- Architectural Decisions
- Scenarios
- Analysis

Risk Themes: distilled into
- Tradeoffs
- Sensitivity Points
- Non-Risks
- Risks

impacts
ATAM evaluations are often conducted in two stages or phases:

- During phase 1 the architect describes the quality attribute goals and how the architecture meets these goals.
- During phase 2 we determine if a larger group of stakeholders agrees with the goals and the results.
ATAM Nominal Phases - 2

Phase 1
(small group, usually one day)
(informal interactions in between phases)

Phase 2
(larger group, usually two days)
(recap and elaborate)

When to use ATAM

Academically, the time to use ATAM is right after the architecture has been specified when there is little or no code.

However, in practice, ATAM has been very effective in the following situations:

• Evaluating alternative candidate architectures
• Evaluating existing systems prior to committing to major upgrades
• Deciding between upgrade or replace
